

How to Install Groovy on Windows | Groovy Installation on Windows

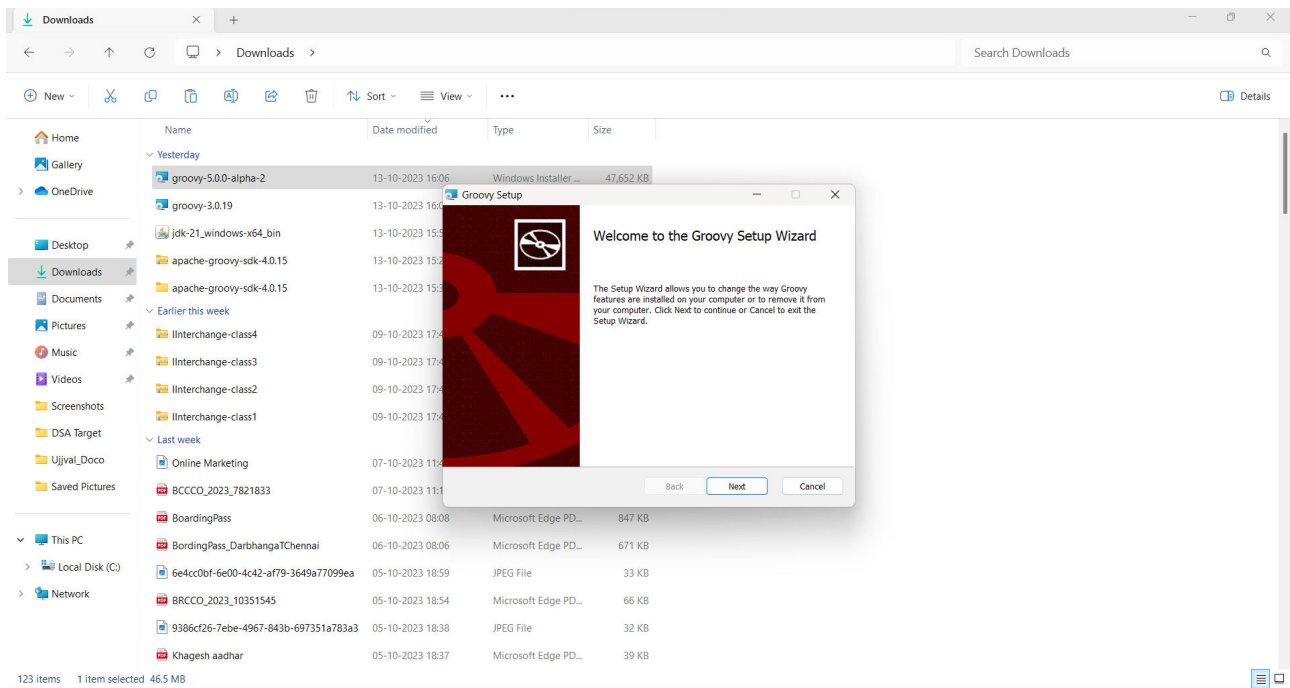

Following are some steps :-

Step1: To install groovy, Java should be installed in our system. If java is already installed then check the version of java by using cmd(java -version), make sure that you have latest java version for latest groovy version. If you are using java-8 then install 3.0 version of groovy.

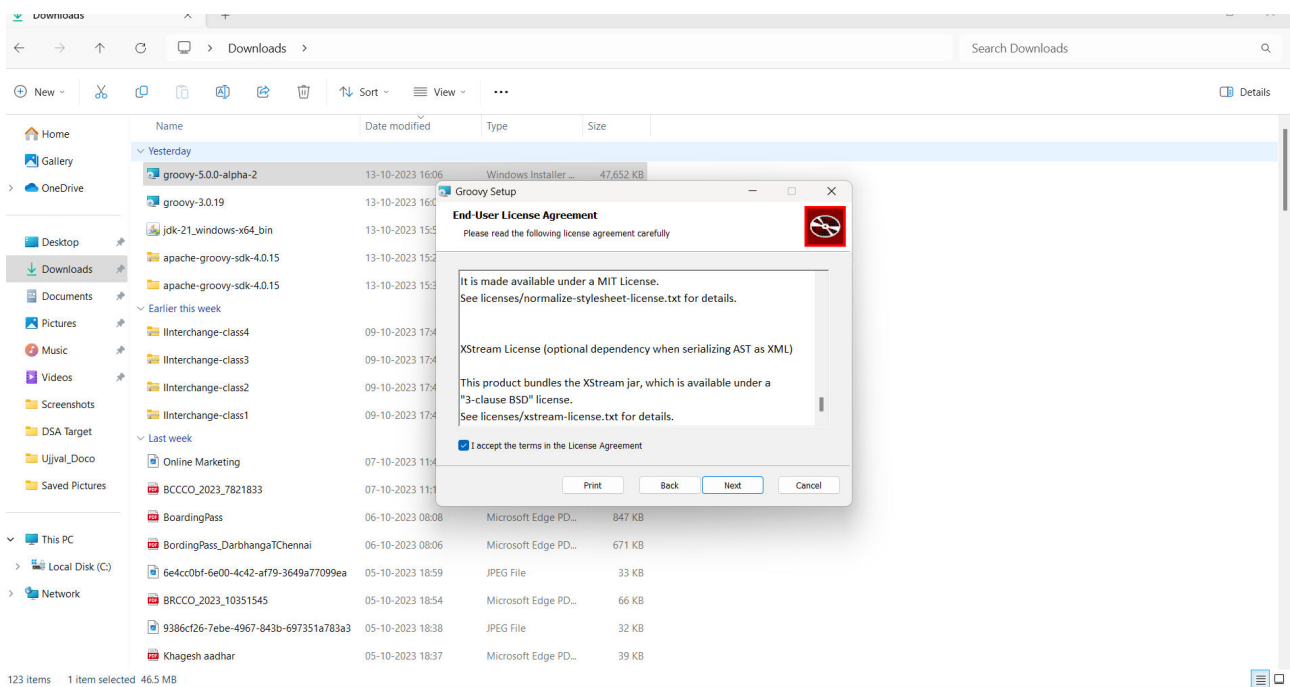

Step2: Visit the official website of groovy. Below is the link :
link - <https://groovy.apache.org/download.html> scroll down and download the <windows installer> as below shown in screenshot -

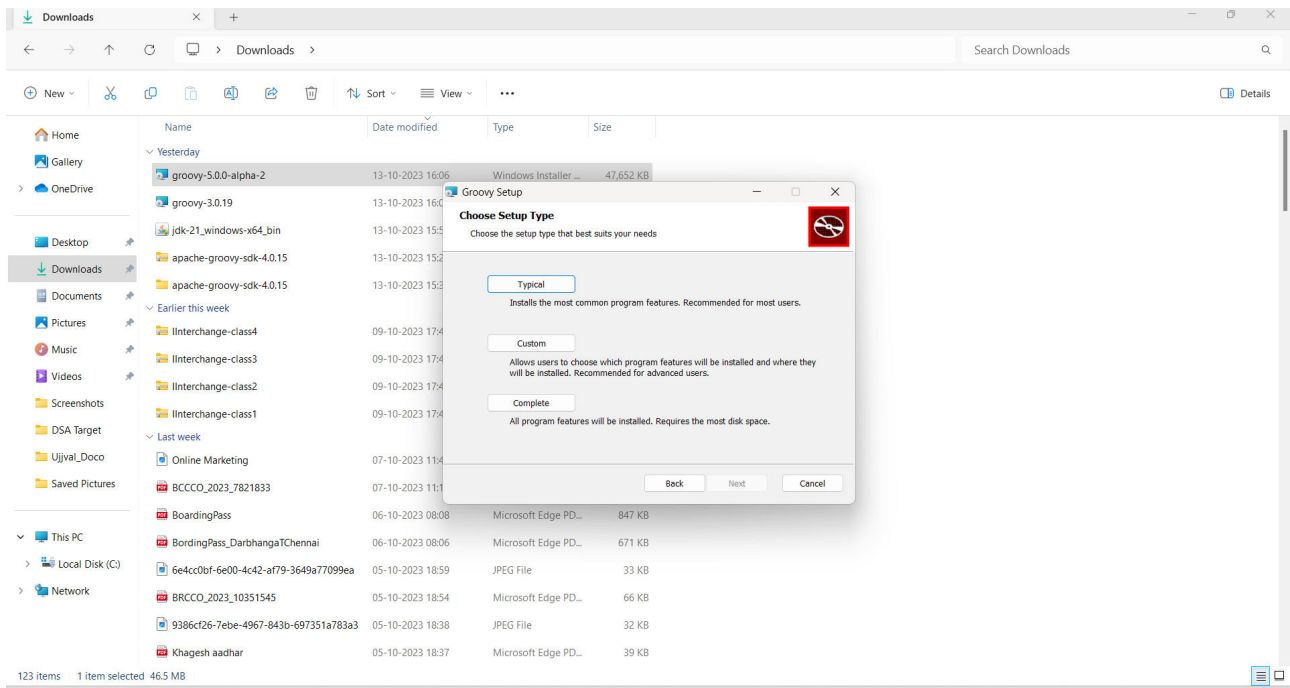

Step3: After Downloading, double click on the installer and it will ask some option click on next.

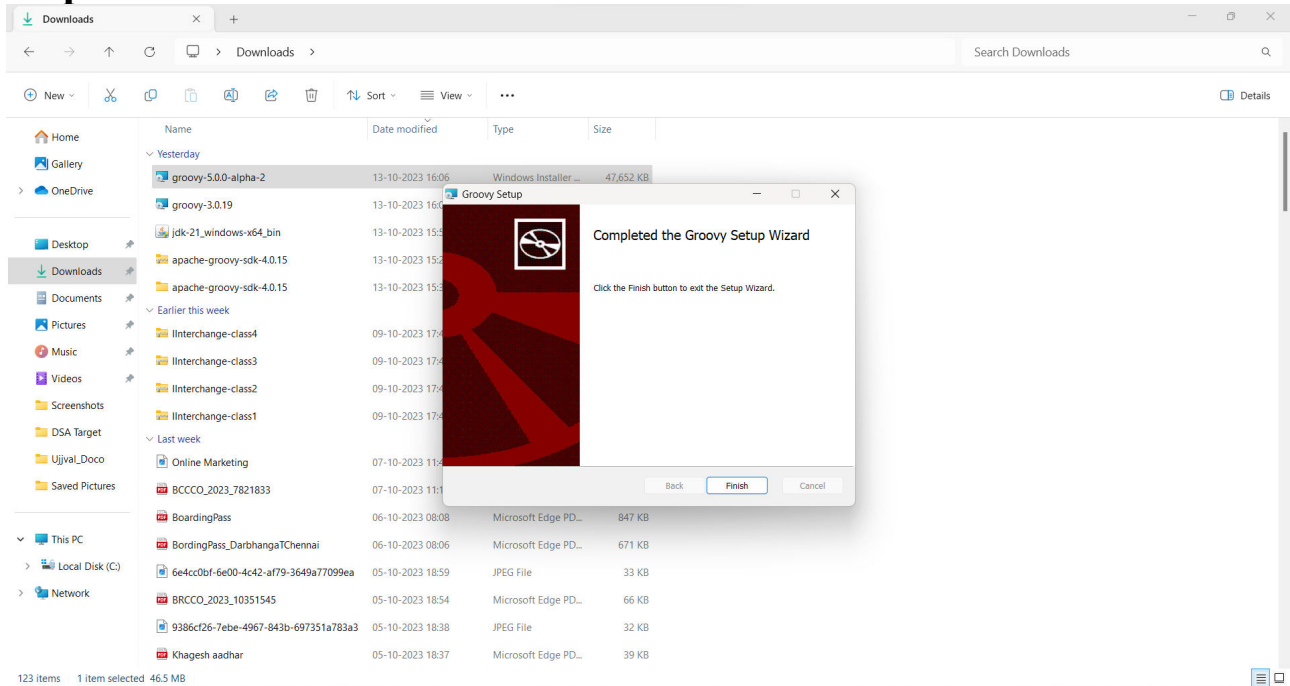

Step4: License Agreement window will appear, click on I accept option and proceed next.

Step5: After option will appear something like this as shown below in screenshot select last option <complete> and click install.

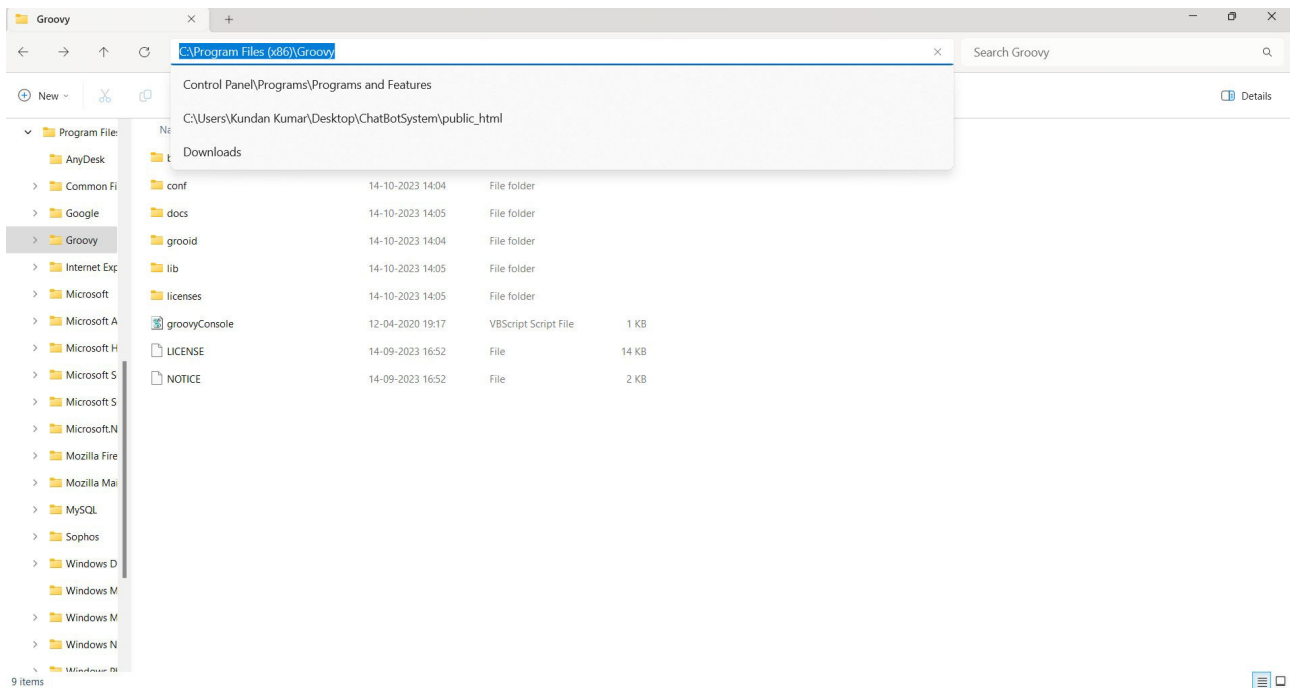

Step6: At last click on finish

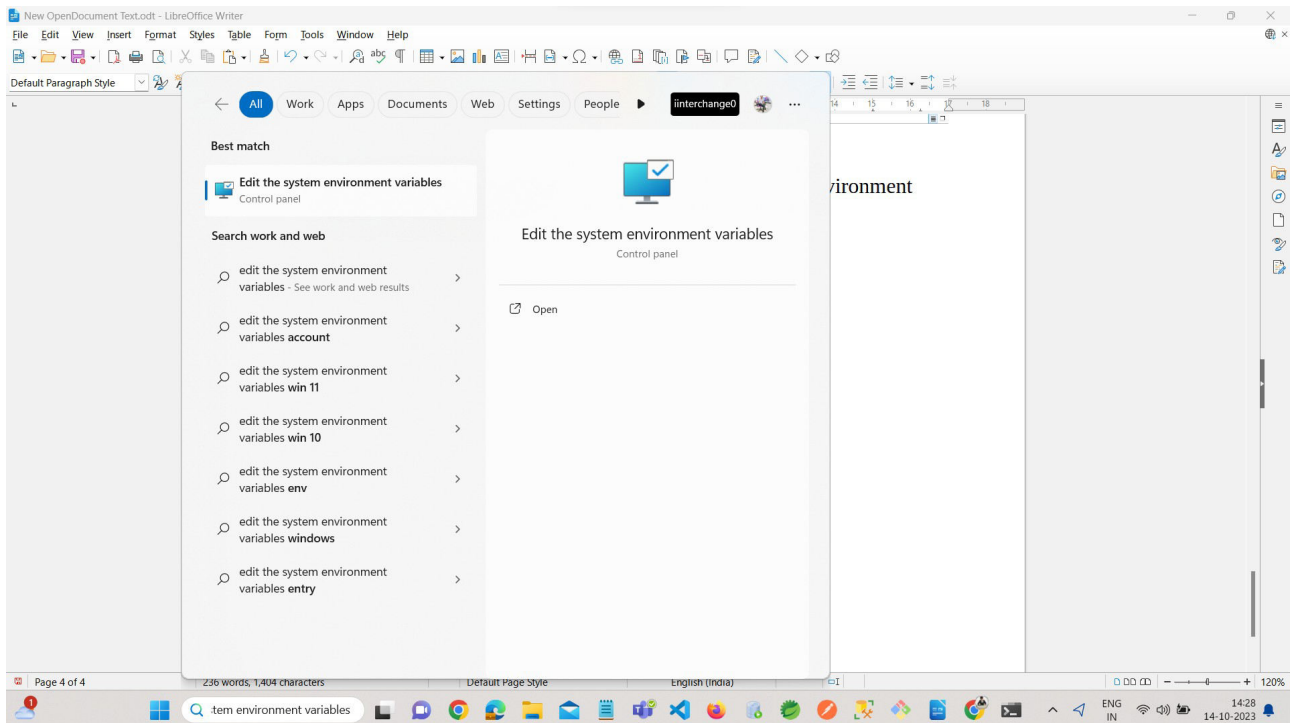

Step7: Now we are finally installed the groovy in our system. This is time to check if successfully installed or not so for that go to command prompt and type (groovy -version). If still groovy is not showing in command prompt then set the environment. Go through next step.

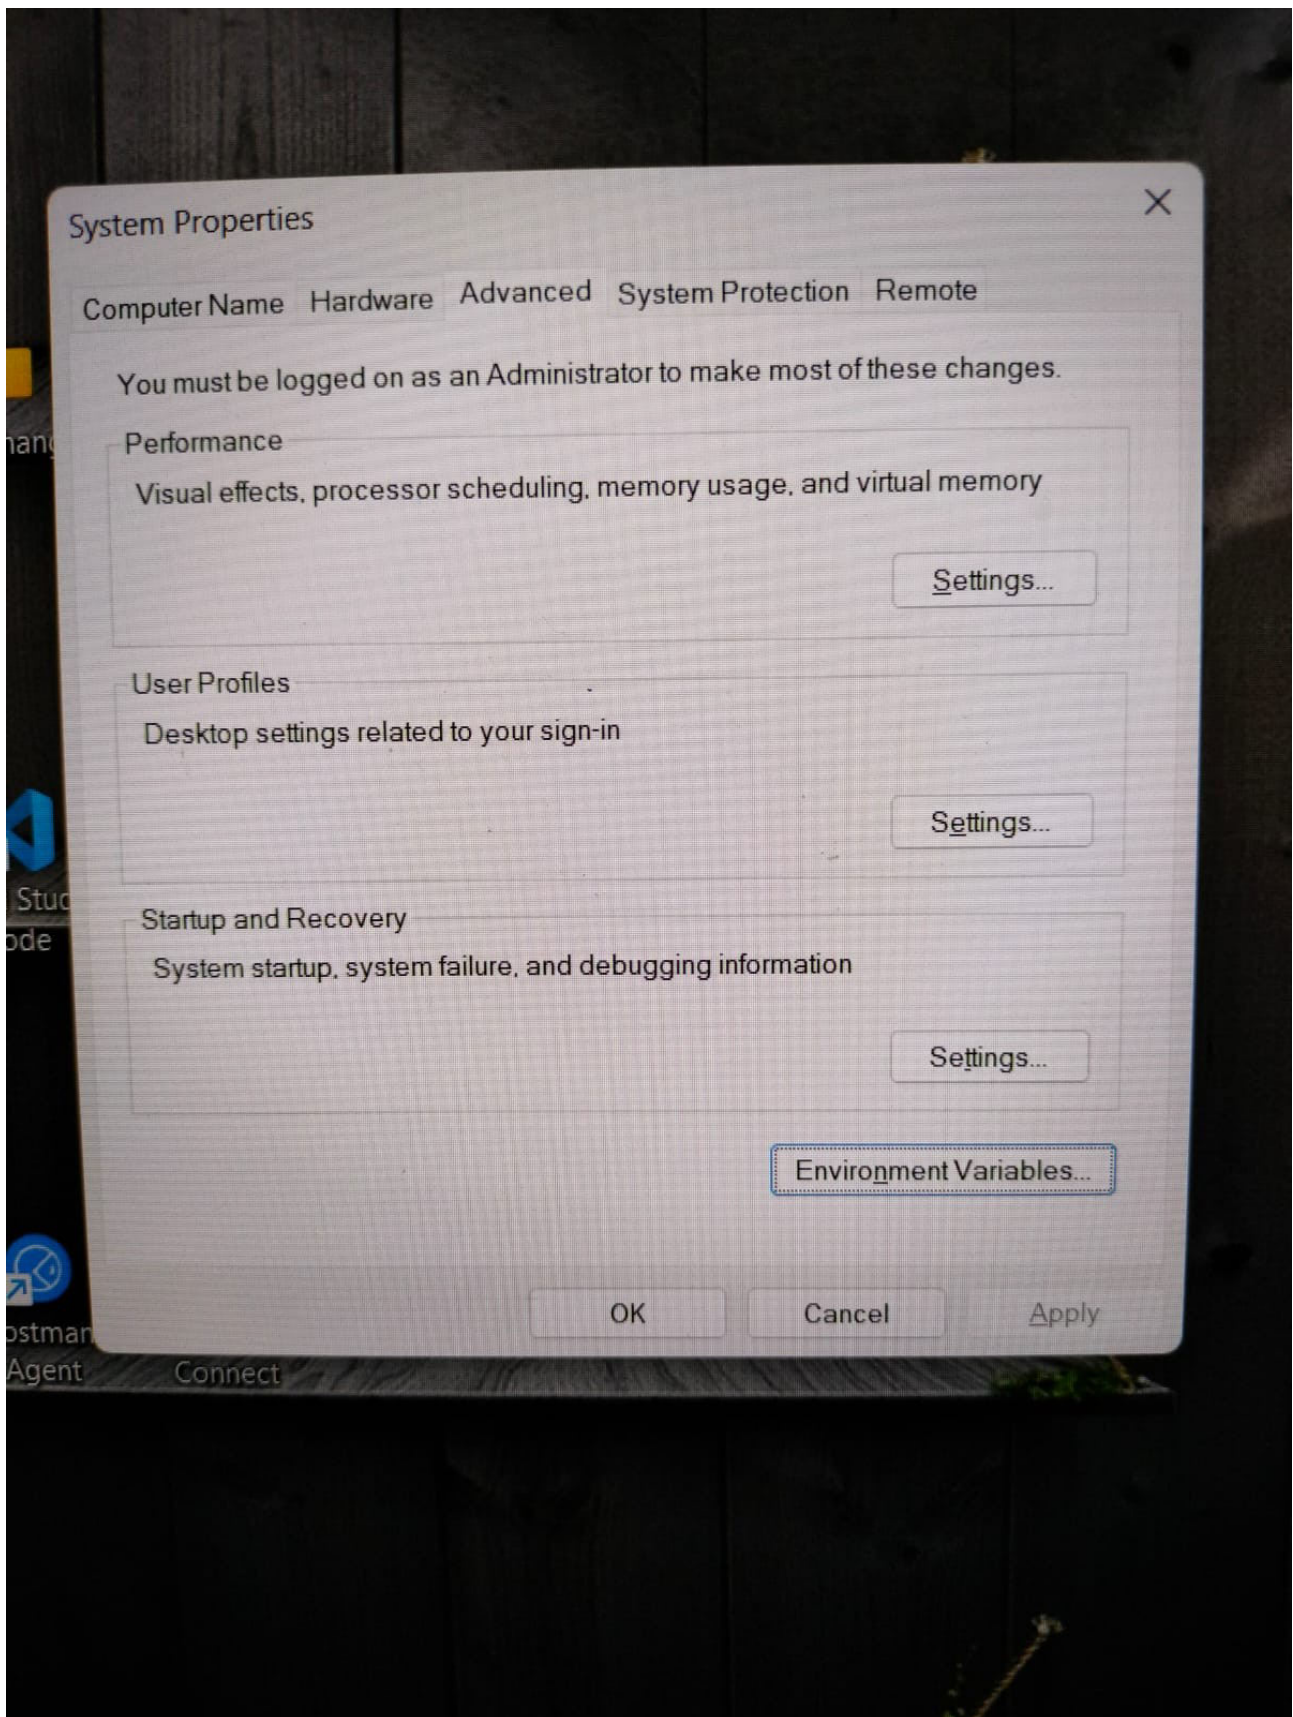

Step8: Go to Local Disk(C)-> Click on Program Files -> Click on Groovy folder-> then copy the path as shown as below.....

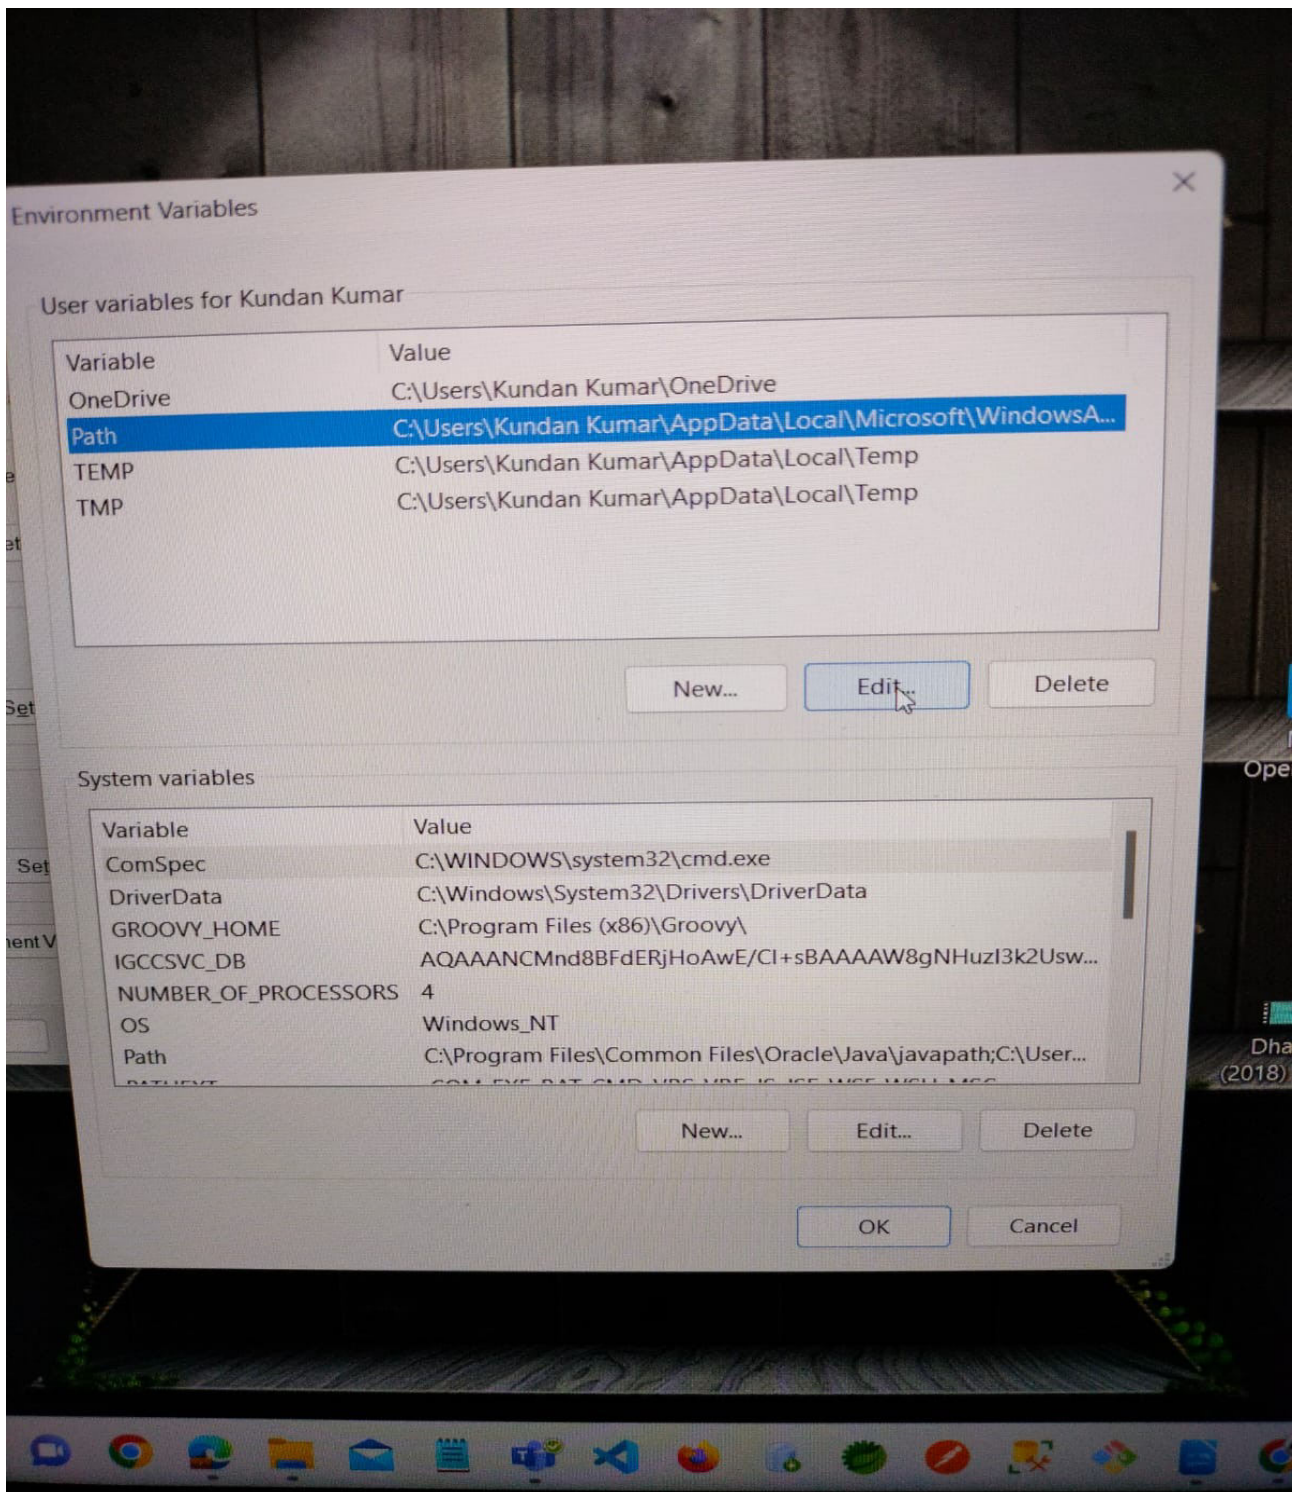

Step9: In window search explorer search <edit the system environment variables> and click on that.

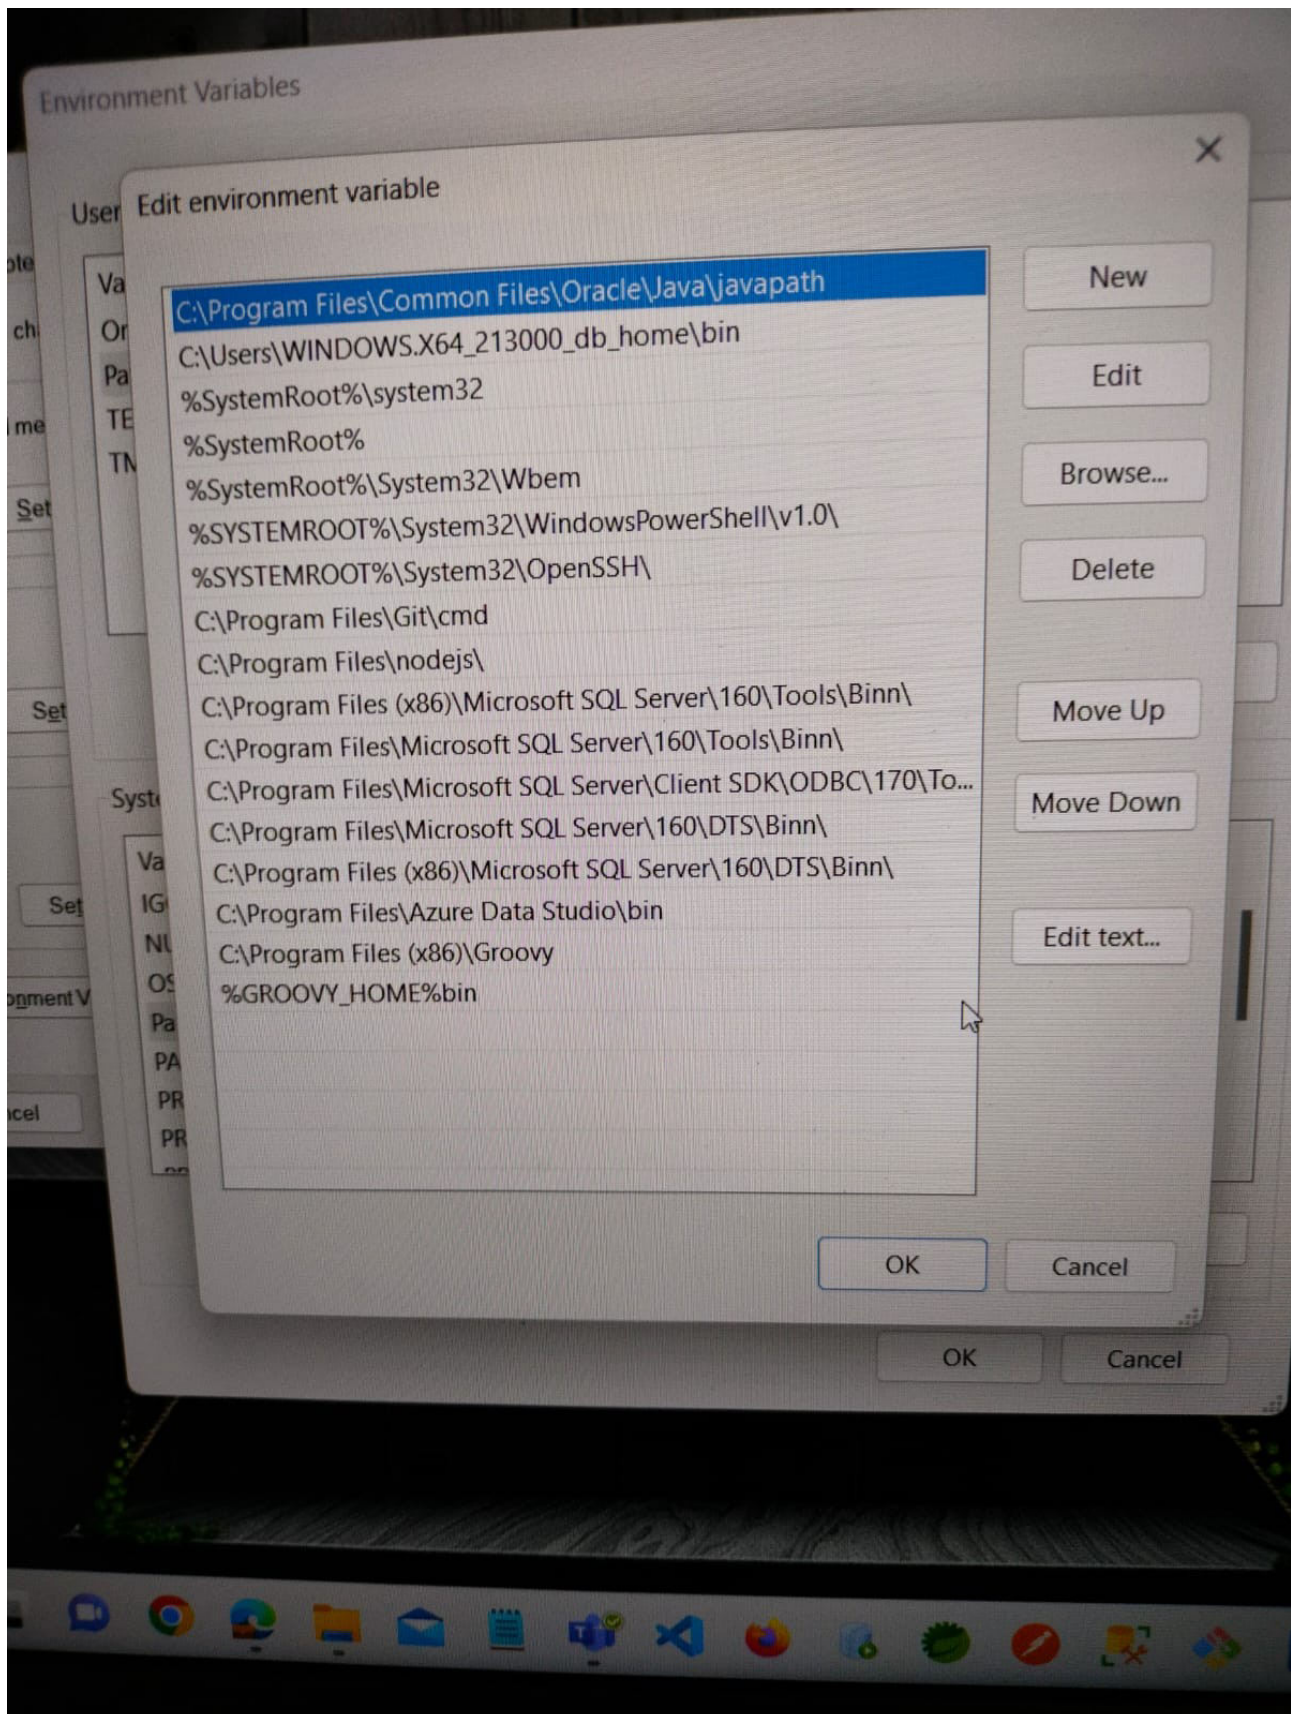

Step10: Click on Environment Variables.

Step11: Click on path and edit (User variables as well as system variables both)

Step12: Click on new -

Step13: paste the path as you copy and click ok.....
